Attachment: ARDIR Soybean (March, 1990)

Exhibit A: Variety ARDIR evolved from a cross of variety 'unknown' x variety A3127. The actual identity of 'unknown' could not be established because seed returned from our Jamaica winter nursery produced segregation in the F5 which could not be explained by the parentage of the cross. Since we were unable to determine what the true parents were, we assigned 'unknown parentage'. ARDIR is an F5-derived variety which was advanced to the F5 generation by modified single-seed descent. The F6 progeny row of ARDIR was grown in Iowa during the summer of 1983. Subsequently, ARDIR has undergone six years of extensive testing and purification and has been observed by the breeder to be uniform and stable for all plant traits from generation to generation, with no evidence of variants.

Six acres of ARDIR (breeders seed) were grown in 1987. 165 acres of parent seedstock (foundation seed equivalent) were grown in 1988.

Exhibit B: Variety ARDIR most closely resembles the variety Elgin. Both varieties have purple flowers, tawny pubescence, and yellow seeds with black hila. However, Elgin exhibits a low seed coat protein peroxidase activity, whereas ARDIR has a high seed coat protein peroxidase activity.

Exhibit E: Pioneer Hi-Bred International, Inc. is the sole, original, and first breeder of soybean variety ARDIR for which it solicits a certificate of protection.
